IMA EXPLORATION INC
Form 6-K
July 10, 2006

UNITED STATES
SECURITIES AND EXCHANGE COMMISSION
WASHINGTON, DC 20549

FORM 6-K

REPORT OF FOREIGN PRIVATE ISSUER PURSUANT TO RULE 13a-16 OR 15d-16 UNDER
THE SECURITIES EXCHANGE ACT OF 1934

For the month of JULY, 2006.

Commission File Number: 001-32558

IMA EXPLORATION INC.

(Translation of registrant's name into English)

#709 - 837 West Hastings Street, Vancouver, British Columbia, V6C 3N6, Canada

(Address of principal executive offices)

Indicate by check mark whether the registrant files or will file annual reports
under cover of Form 20-F or Form 40-F: FORM 20-F FORM 40-F

Indicate by check mark if the registrant is submitting the Form 6-K in paper as
permitted by Regulation S-T Rule 101(b)(1): _____

Indicate by check mark if the registrant is submitting the Form 6-K in paper as
permitted by Regulation S-T Rule 101(b)(7): _____

Indicate by check mark whether the registrant by furnishing the information
contained in this Form, is also thereby furnishing the information to the
Commission pursuant to Rule 12g3-2(b) under the Securities Exchange Act of 1934.
YES NO

If "Yes" is marked, indicate below the file number assigned to the registrant in
connection with Rule 12g3-2(b): 82-_____

SIGNATURES

Pursuant to the requirements of the Securities Exchange Act of 1934, the
registrant has duly caused this report to be signed on its behalf of the
undersigned, thereunto duly authorized.

NEWS RELEASE - JULY 10, 2006

PHASE IV DRILLING AT NAVIDAD INTERSECTS MORE SILVER AT LOMA DE LA PLATA FOR IMA EXPLORATION INC.

IMA EXPLORATION INC. (IMR-AMEX, IMR-TSX.V) is pleased to announce results for the ongoing Phase IV drilling at its 100% owned Navidad Project in Patagonia, Argentina. Sixteen new drill holes are reported on here including five new holes drilled at Loma de la Plata (see Table). Loma de la Plata is one of several zones along the 8km long Argenta Trend, located 3km southwest of the known Navidad deposits. Significant results from the new Loma de la Plata drilling include 11.0m of 897 grams per tonne (g/t) silver in hole 319 and 24.0m of 217 g/t silver in hole 323. Of the remaining eleven holes eight were drilled at Calcite NW and three at Calcite Hill.

Drilling to date has tested a portion of the known mineralization at Loma de la Plata (see attached map) and continues to confirm the results of surface trenching. Mineralization in the five new holes and the five previously drilled holes (October 13, 2005) always starts at surface and is hosted by the favourable upper-volcanic sequence comprised of quartz-eye bearing trachyandesites. This unit dips approximately 25 to 30 degrees towards the northeast and is approximately 20 to 35m thick in the area drilled to date.

Mineralization noted in the Loma de la Plata holes is associated with minor veinlets and narrow intervals of brecciation both of which contain carbonate gangue minerals with lesser amounts of quartz and barite. Sulphide content is generally very low, never exceeding two percent. Minor amounts of galena, copper oxides, probable silver-copper sulphosalts, and traces of native silver were noted during the logging. The form and shape of zones of veinlets and brecciation is not yet well defined, but they are hosted within the trachyandesite upper volcanic rocks. Newly drilled holes show that a sedimentary interval at the base of the favourable volcanic unit can also be mineralized with small quantities of disseminated sulphides and towards the northeast can have grades of potential economic interest (see hole 322 from 29.75 to 37.0m containing 7.25m of 88 g/t silver). No resource estimation has yet been undertaken at Loma de la Plata.

The three holes drilled at Calcite Hill are infill holes to provide more detailed information and the shape and grade of the deposit; holes 317 and 318 produced some of the best ever results at Calcite Hill including 124.0m grading 296 g/t silver and 112.6m grading 209 g/t silver and 2.91% lead respectively.

Similarly eight infill holes were drilled at Calcite NW also produced good results including 33m at 138 g/t silver in hole 310 and 11.0m grading 443 g/t

Edgar Filing: IMA EXPLORATION INC - Form 6-K

silver in hole 314.

Phase IV drilling in 2006 comprises more than 16,000 m in 96 holes and is ongoing. Results have now been released for 72 of these holes and periodic releases will be made to keep shareholders informed of developments at the Project.

An updated summary of collar locations and hole orientations and lengths is available on IMA's website (WWW.IMAEXPLORATION.COM), as is a summary of IMA's rigorous, quality-control and quality-assurance procedures. Dr. Paul Lhotka, P.Geo. is IMA's "Qualified Person" at the Navidad project and has supervised all aspects of the current technical program and has reviewed the contents of this release.

Notes:

1. True thickness has not been calculated for these holes.
2. All length weighted averages (LWA) are "uncut" ie have no grade capping.
3. Silver equivalent calculated using US\$6.00/oz silver and \$0.35/lb lead. (AgEq = Ag + (%Pb*10,000/250). No attempt has been made to adjust these relative values by accounting for metallurgical recoveries as insufficient information is available to do so. This the same method as used in the resource calculation release on February 16, 2006.
4. Results for hole NV05-241 are corrected herein from the original press release (October 13, 2005) which had a data entry error that affected the length weighted average grade calculation.
5. A complete list of all results to date is available on IMA's website (www.imaexploration.com).
