

**Item 8.01 Other events**

Agenus Inc. announced today statistically significant top-line results from its Phase 2 randomized, double-blind, multi-center study for HerpV, a recombinant “off-the-shelf” therapeutic vaccine candidate for the treatment of patients with herpes simplex virus-2 (HSV-2). HerpV contains a defined mixture of peptides representing HSV-2 antigens plus Agenus’ QS-21 Stimulon® adjuvant. The majority of subjects in the study have received a booster injection of HerpV that was given six months after the first vaccination followed by determination of genital viral shedding for an additional 45-day period. Post-booster viral shedding results, along with immune response data, are anticipated in the first half of 2014.

The full text of the press release issued in connection with the announcement is being filed as Exhibit 99.1 to this current report on Form 8-K.
